

## Sprint 3 Network Diagram:

### Steps to stay on schedule:

- Discuss user story scope and pathway in greater detail during the planning meeting to ensure development goes smoothly from the start.
- Running standups every two days, allowing us to keep on track of our own and others' work, resolving any blockers along the way.
- Update progress of user stories on Jira to provide small updates to the team throughout the sprint.

### Critical Path

- The critical path of this diagram is from CGP-24 to CGP-23.
- Despite having one dependency, it was a comparatively small dependency that still allowed us to easily finish development on time.
- We were able to complete all user stories this sprint because we focused on eliminating dependencies that made the last sprint more difficult.

### What we learned:

- We learned of the great importance of tracking dependencies early in the sprint, as it makes planning simpler and development smoother.
- This sprint's progress was much less rocky because of our forward thinking.
